

Event Registration - Form creation Using Zoho Creator

Name	Jannani R
Roll Number	241401031
Department	Computer Science and Business Systems (CSBS)
Year/Semester	III year / V Semester
Course	Low-Code Application Development using Zoho Creator

Overview

This report presents the development of an Event Registration application using Zoho Creator, a low-code application development platform. The application is designed to collect participant information, event preferences, contact details, and agreement to the event rules through a structured online form.

The report covers the design of the registration form, selection and configuration of suitable field types, use of mandatory fields and predefined choices, deployment of the form as a live application, testing with sample records, and verification of the stored information in the generated database table. The approach can be adapted for workshops, seminars, competitions, training programmes, conferences, and other events that require online registration.

Introduction and Application Environment

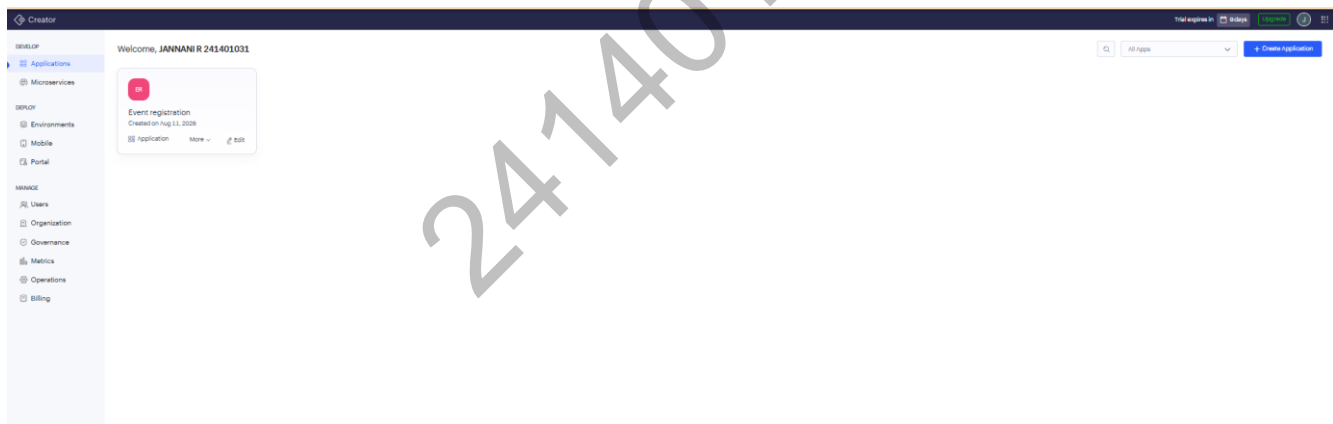

Zoho Creator provides a low-code environment for developing applications with forms, reports, workflows, and data storage. An Event Registration application can be created without developing a complete web application from the beginning. The form acts as the main point of interaction between the participant and the application, while the submitted information is stored in the application's data structure for later use.

Application Details

- The application begins with a blank form so that the required registration structure can be designed according to the event requirements.
- Zoho Creator's application workspace provides access to configuration and development tools through the application interface.
- The Form component is created using the From Scratch option when complete control over the fields and layout is required.
- A clear form structure should be planned before adding fields. The information can be grouped into participant details, contact information, organization details, event preferences, and confirmation requirements.
- Using a low-code platform reduces the amount of manual programming required for basic data collection and storage.

Practical Consideration

A well-planned form should collect only information that is useful for registration and event management. Grouping related information also makes the form easier for participants to understand and makes the resulting database easier to maintain.

Form Design and Field Configuration

The main part of the application is the registration form. Different field types are selected according to the kind of information expected from the participant. Using appropriate fields improves data quality and gives users a clearer way to enter their information.

Application Details

- Participant Name is represented using First Name and Last Name fields, allowing the participant's name to be stored in a structured format.
- Participant Type uses Radio buttons with Student, Faculty, and Professional as the available choices. Radio buttons are suitable when only one option should be selected.
- Team Size uses a Number field so that numerical information can be entered consistently.
- Email Address and Contact Number provide the main communication details required for registration.
- College/Organization Name uses a text field for identifying the participant's institution or organization.
- Institution Address uses a multi-line text field because an address may contain several pieces of information.
- Clear field labels are important because they tell participants exactly what information is expected.

Practical Consideration

Field selection affects both the user experience and the stored data. Fixed choices such as participant type are better represented using selection controls, while descriptive information such as expectations or addresses is better collected using text areas.

The screenshot displays the Zoho Creator interface for designing an 'Event Registration' form. On the left, a 'Basic Fields' panel lists various field types: Name, Email, Address, Phone, Single Line, Multi Line, Number, Date, Time, Drop Down, Radio, Multi Select, and Checkbox. Below this is an 'Advanced Fields' panel with Decision Box, Rich Text, Link, and Image. The central workspace shows a form layout with fields like 'Participant Name', 'Participant Type', 'Team Size', 'Email Address', 'Contact Number', 'College/Organization Name', 'Institution Address', 'Event Track', 'Involvement', 'Expectations from Event', 'Preferred Session Date', 'Preferred Session Slot', and 'Agree to Code of Conduct'. A large diagonal watermark '241401031' is overlaid on the workspace. On the right, a 'Field Properties' panel for the 'Participant Name' field shows settings for Field Name, Field ID, Validation, Display Fields (First Name, Last Name, Suffix), Data Privacy, Data Security, Appearance, Field type, Field size, and Description.

Registration Requirements and Validation

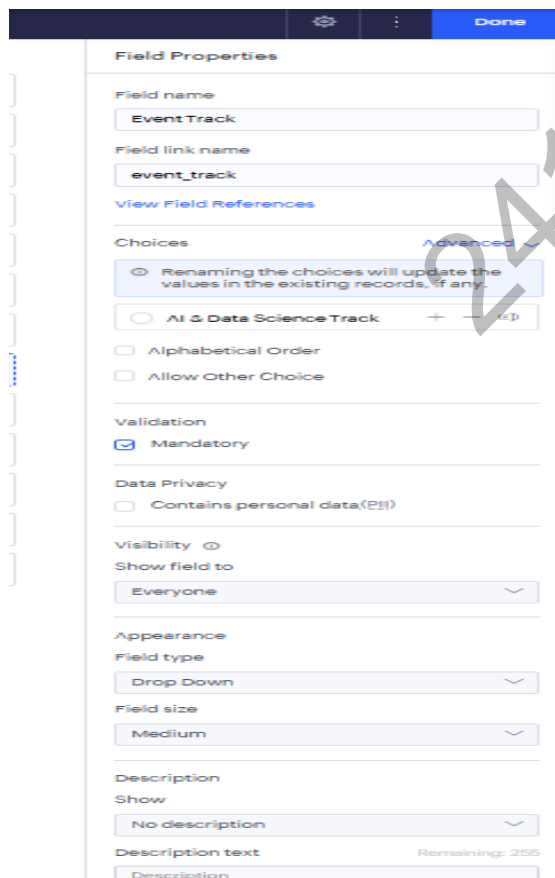

The registration form includes additional event-specific fields and validation rules to make the collected information complete and consistent. Mandatory fields are used for information that is essential to the registration process, while optional fields can be left open for additional responses.

Application Details

- Event Track is provided as a Dropdown field containing the available event topics. It is marked as mandatory so that every registration is associated with a selected track.
- Areas of Interest and Expectations are provided as text fields so participants can describe the subjects they are interested in and what they expect from the event.
- Preferred Session Date is represented using a Dropdown field when participants must select from the available dates.
- Preferred Session Slot is provided as a Dropdown field for choosing an available session period.
- The Code of Conduct is represented by a mandatory Checkbox. The participant must accept the stated rules before submitting the registration.
- Mandatory settings should be applied only to essential information. This prevents unnecessary restrictions while still ensuring that the database contains the data required for event management.

Practical Consideration

Validation improves the reliability of collected information. Dropdowns reduce inconsistent spellings, while mandatory fields prevent incomplete registrations. These simple controls are especially useful when the collected records will later be filtered, reviewed, or exported.

The screenshot shows the 'Field Properties' panel in Zoho Creator for a field named 'Event Track'. The panel is divided into several sections:

- Field name:** 'Event Track'
- Field link name:** 'event_track'
- View Field References:** A link to view references.
- Choices:** A section with a 'Renaming the choices will update the values in the existing records, if any.' warning. It shows a single choice 'AI & Data Science Track' with a plus sign to add more. There are also checkboxes for 'Alphabetical Order' and 'Allow Other Choice'.
- Validation:** A checkbox for 'Mandatory' is checked.
- Data Privacy:** A checkbox for 'Contains personal data (PII)' is unchecked.
- Visibility:** A dropdown for 'Show field to' is set to 'Everyone'.
- Appearance:** A dropdown for 'Field type' is set to 'Drop Down' and a dropdown for 'Field size' is set to 'Medium'.
- Description:** A dropdown for 'Show' is set to 'No description'. Below it is a text input for 'Description text' with a character count 'Remaining: 255'.

Application Deployment and Live Form

After the form configuration is completed, it can be accessed as a live application. The live version provides the user-facing registration page and separates the participant experience from the form-building workspace.

Application Details

- The Access this application option is available in the application interface and opens the user-facing version of the application.
- The live form presents the configured fields, choices, mandatory requirements, and submission controls to the participant.
- The live version should be reviewed before sharing it with actual users to make sure the field order, labels, choices, and required settings are correct.
- Deployment testing is also useful for identifying layout or configuration issues that may not be obvious while working inside the form builder.
- Once the form has been verified, the live application can be used as the registration interface for the intended event.

Practical Consideration

A live-form check should be treated as part of the development process rather than as the final step alone. It confirms that the form behaves from the user's point of view and that the configured fields are presented as expected.

The screenshot displays a web-based event registration form. On the left, a dark sidebar contains navigation links: Home, Student Status, Add New, Event Registrations (highlighted), and All Event Registrations. The main content area is titled 'Event Registration' and contains the following fields:

- Participant Name:** Two text boxes for 'First Name' and 'Last Name'.
- Participant Type:** Radio buttons for 'Student', 'Faculty', and 'Professional'.
- Team Size:** A text box with a placeholder '#####'.
- Email Address:** A text box.
- Contact Number:** A text box with a country code dropdown (VPS) and a placeholder '81234 56789'.
- College Organization Name:** A text box.
- Institution Address:** Two text boxes for 'Address Line 1' and 'Address Line 2'.
- City / District:** A text box.
- State / Province:** A dropdown menu.
- Postal Code:** A text box.
- Country:** A dropdown menu.
- Event Track:** A dropdown menu.
- Area of Interest:** A dropdown menu.
- Expectations from Event:** A dropdown menu.
- Preferred Session Date:** A date picker (dd-mm-yyyy).
- Preferred Session Slot:** A dropdown menu.
- Agree to Code of Conduct:** A checkbox with a link to 'Agree to the event code of conduct/Choice 1'.

A blue 'Submit' button is located at the bottom of the form. A large, diagonal watermark '241401031' is overlaid on the form.

Testing and Sample Data Entry

Testing verifies that the registration form accepts valid information, enforces mandatory requirements, and creates records correctly. Sample data can be used during testing so that the actual event database is not affected by incomplete or incorrect entries.

Application Details

- The live registration form is opened and completed using sample participant information.
- Required fields are checked to confirm that incomplete submissions are not accepted when essential information is missing.
- The Event Track selection and Code of Conduct agreement are included in the test because both are mandatory requirements.
- After all required information is entered, the Submit button is used to send the registration to the application.
- The form is refreshed or reopened and two additional sample submissions are entered.
- Three test records are therefore created to verify that the system can handle more than one registration.
- Testing with multiple records also makes it possible to check whether values appear in the correct database columns.

Practical Consideration

A good test should not only confirm that the Submit button works. It should also check required fields, different choices, numerical values, contact information, and the final database records. This gives greater confidence before the form is used for a real event.

The screenshot shows a web application interface for event registration. The left sidebar contains navigation links: Home, Student Status, Add New, Event Registrations (selected), and All Event Registrations. The main content area is titled 'Event Registration' and contains a form with the following fields and options:

- Participant Name:** First Name (sard) and Last Name (S).
- Participant Type:** Radio buttons for Student (selected), Faculty, and Professional.
- Team Size:** Text input with value 1.
- Email Address:** Text input with value sard@gmail.com.
- Contact Number:** Text input with value +91 76855 67896.
- College Organization Name:** Text input with value Test organization.
- Institution Address:** Text input with value 123 Main Street.
- Address Line 1:** Text input.
- Address Line 2:** Text input.
- City / District:** Text input.
- State / Province:** Text input.
- Postal Code:** Text input.
- Country:** Text input.
- Event Track:** Dropdown menu with value AI & Data Science Track.
- Area of Interest:** Text input with value Cloud Computing.
- Expectations from Event:** Text input with value Learning.
- Preferred Session Date:** Text input with value 17-Aug-2026.
- Preferred Session Slot:** Text input with value 21:47:35.
- Agree To Code Of Conduct:** Radio button for I agree to the event code of conduct (selected).

At the bottom of the form are two buttons: Update and Cancel.

Database Verification and Results

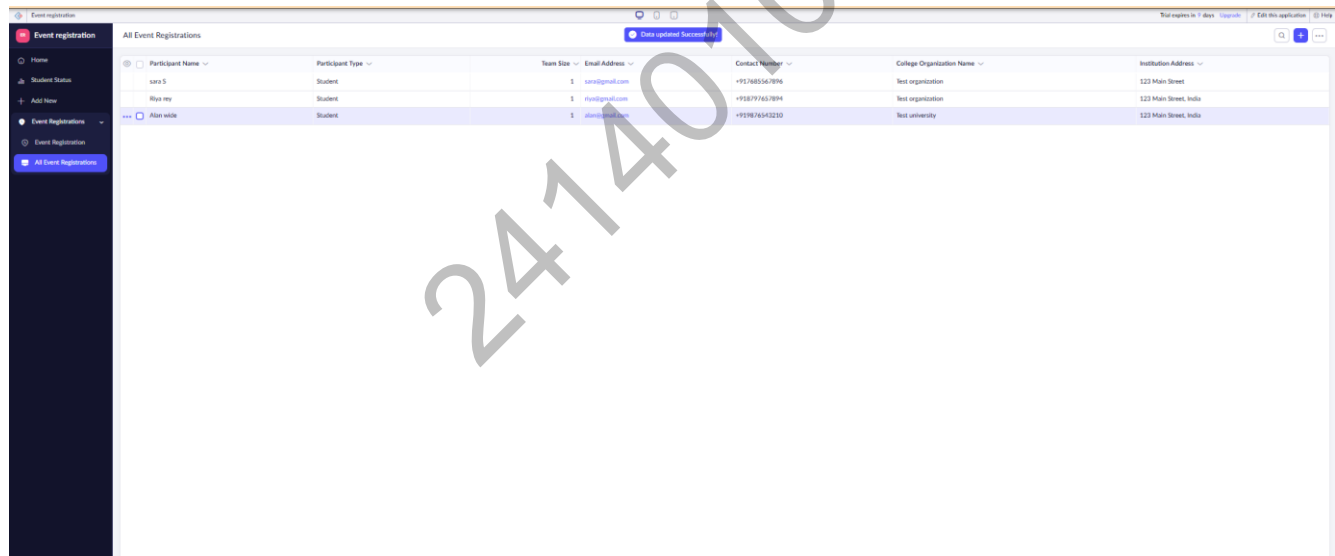

Zoho Creator stores the information submitted through the form in the application's data structure. The All Event Registrations view provides a spreadsheet-style representation of the collected records. This view can be used to confirm that the form fields and submitted values have been stored correctly.

Application Details

- The All Event Registrations option is opened from the application sidebar.
- The resulting database grid displays the fields from the registration form as individual columns.
- Each participant submission is represented as a separate row in the table.
- The column structure makes it possible to review participant information, event preferences, contact details, and other registration data in one place.
- The three test submissions are verified under the names “sara 5”, “Riya rey”, and “Alan wide”.
- Successful appearance of all three records confirms that the live form is connected correctly to its stored data.
- The completed application therefore demonstrates the complete flow from form design and user input to database storage.

Practical Consideration

Database verification is an important part of a low-code application because it confirms that the front-end form and the stored data are working together. Once the test records are visible in the correct columns, the application is ready for further refinement or controlled use.

The screenshot displays the 'All Event Registrations' view in Zoho Creator. The interface includes a sidebar with navigation options like Home, Student Status, Add New, Event Registrations, and All Event Registrations. The main area shows a table with the following data:

Participant Name	Participant Type	Team Size	Email Address	Contact Number	College Organization Name	Institution Address
sara 5	Student	1	sara5@gmail.com	+919855618994	Test organization	123 Main Street
Riya rey	Student	1	riyarey@gmail.com	+988779461094	Test organization	123 Main Street, India
Alan wide	Student	1	alanwide@gmail.com	+919876543210	Test university	123 Main Street, India
